

## Net Neutrality

We support the principle of Net Neutrality, which entails ensuring that all Internet traffic is treated equally, without any blocking, throttling, or paid prioritization. At Cynetel, we adhere to this principle and do not prioritize packet transmissions based on content, source, or recipient. We utilize network management tools to minimize harm to our network users when faced with network problems, such as congestion or fiber cuts.

We believe that the application layer should remain independent from the network to best serve both the customer and the Internet as a whole. Innovation in application development is fueled by individuals' ability to reach as many people as possible without complicated gating factors such as tiered pricing or bandwidth structures used by legacy service providers. In a free market economy, such as the Internet today, applications can proliferate without hindrance.

It is our opinion that the Federal Communications Commission's decision to rescind its Net Neutrality rules is detrimental to both Internet users and the Internet itself. We remain committed to Net Neutrality and will continue to uphold this principle at Cynetel.
